### P8160 - Breast Cancer Data: To lasso or to not lasso

Amy Pitts, Hun Lee, Jimmy Kelliher, Tucker Morgan, and Waveley Qiu

2022-03-28

### Motivation

Diagnosing breast cancer is extremely important.

According to NIH there has been an estimated:

- ▶ 281,550 new cases of breast cancer in women in 2021,
- ▶ 43,600 breast cancer in women related deaths in 2021.

American Cancer Society Guideline for Breast Cancer Screening:

- ► Women between ages 25-40 should have an annual clinical breast examination.
- ▶ Women between ages 40-44 should begin annual screening via mammogram
- Women between ages 45-54 should screened annually via mammogram

### Goal

With using all the collected imagine data we want to develop an algorithm to predict diagnosis. Since diagnosis is a binary outcome a logistic regression will be utilized.

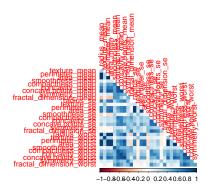

#### Methods:

- Newton-Raphson Algorithm (Full Model)
- ► Logistic LASSO Algorithm (Optimal Model)

### Data

- ▶ 569 rows and 31 columns all related to breast tissue images
- Outcome of interest: Diagnosis (B or M)
  - ▶ 357 benign (B) cases and 212 malignant (M) cases
- ► The Covariates include information such as radius, texture, perimeter, area, smoothness, compactness, concavity, concave points, symmetry, and fractal dimension.

# Figure 1: Correlation Heat Plot of all Covariates

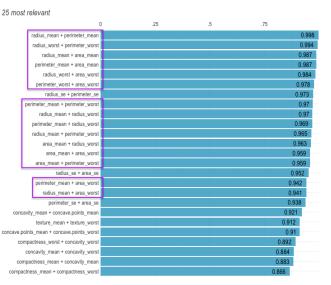

# Figure 1: Ranked Cross-Correlations

#### 25 most relevant

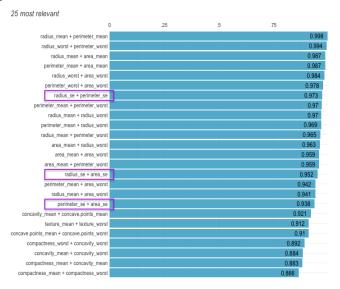

|  | 0 | .25 | .5 | .75   |
|--|---|-----|----|-------|
| radius_mean + perimeter_mean               |   |     |    | 0.998 |

# Full Model (Newton-Raphson)

Consider the following log-likelihood, gradient, and hessian matrix. First, let

$$\pi_i = P(Y_i = 1 | x_{i,1}, \dots x_{i,p}) = \frac{e^{\beta_0 + \sum_{j=1}^p \beta_j x_{i,j}}}{1 + e^{\beta_0 + \sum_{j=1}^p \beta_j x_{i,j}}}.$$

### The log-likelihood:

$$I(\mathbf{X}|\vec{\beta}) = \sum_{i=1}^{n} \left[ y_i \left( \beta_0 + \sum_{i=1}^{p} \beta_j x_{i,j} \right) - \log \left( 1 + \exp \left( \beta_0 + \sum_{i=1}^{p} \beta_j x_{i,j} \right) \right) \right]$$

### <del>-</del>. . .

$$\nabla I(\mathbf{X}|\vec{\beta}) = \begin{bmatrix} \sum^{n} y_{i} - \pi_{i} & \sum^{n} x_{i,1}(y_{i} - \pi_{i}) & \dots & \sum^{n} x_{i,p}(y_{i} - \pi_{i}) \end{bmatrix}_{1 \times (p+1)}^{T}$$
The hessian: produces a matrix  $(p+1 \times p+1)$ 

$$abla^2 I(\mathbf{X}|ec{eta}) = -\sum_{i=1}^n egin{pmatrix} 1 \ X \end{pmatrix} ig(1 \quad Xig) \, \pi_i (1-\pi_i)$$

# Optimal Model (Logistic LASSO)

Lemma 1. Consider the optimization problem

$$\min_{x \in \mathbb{R}} \left\{ \frac{1}{2} (x - b)^2 + c|x| \right\}$$

for  $b \in \mathbb{R}$  and  $c \in \mathbb{R}_{++}$ . It follows that the minimizer is given by

$$\hat{x} = S(b, c),$$

where S is the soft-thresholding operator.

Lemma 2. Consider the optimization problem

$$\min_{\beta_k \in \mathbb{R}} \left\{ \frac{1}{2n} \sum_{i=1}^n w_i \left( z_i - \sum_{j=1}^p \beta_j x_{ij} \right)^2 \right\}$$

for some  $k \in \{1, ..., p\}$ . It follows that the minimizer is given by

$$\hat{\beta}_k = \left(\sum_{i=1}^n w_i x_{ik}^2\right)^{-1} \sum_{i=1}^n w_i x_{ik} \left(z_i - \sum_{i \neq k} \beta_j x_{ij}\right).$$

# Optimal Model (Logistic LASSO)

**Lemma 3.** With  $\hat{\beta}_k$  defined as above,

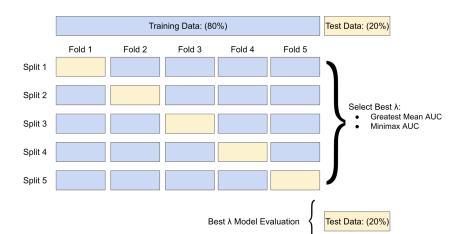

$$\min_{\beta_k \in \mathbb{R}} \left\{ \frac{1}{2n} \sum_{i=1}^n w_i \left( z_i - \sum_{j=1}^p \beta_j x_{ij} \right)^2 + \lambda \sum_{j=1}^p |\beta_j| \right\}$$

$$= \min_{\beta_k \in \mathbb{R}} \left\{ \frac{1}{2} (\beta_k - \hat{\beta}_k)^2 + \left( \frac{1}{n} \sum_{i=1}^n w_i x_{ik}^2 \right)^{-1} \lambda |\beta_k| \right\}.$$

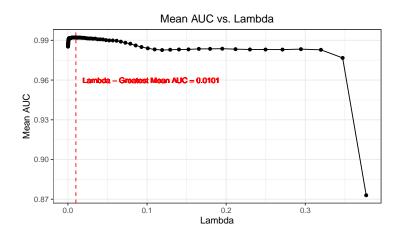

By Lemma 1 and Lemma 3,

$$\begin{aligned} & \underset{\beta_k \in \mathbb{R}}{\arg\min} \left\{ \frac{1}{2n} \sum_{i=1}^n w_i \left( z_i - \sum_{j=1}^p \beta_j x_{ij} \right)^2 + \lambda \sum_{j=1}^p |\beta_j| \right\} \\ &= S\left( \hat{\beta}_k, \left( \frac{1}{n} \sum_{i=1}^n w_i x_{ik}^2 \right)^{-1} \lambda \right) \end{aligned}$$

# Coefficients Comparison

Final Beta Coefficient Estimates

| Measures                                  | NewtonRaphson | LASSO_GreatestMeanAUC | LASSO_MinimaxAUC |
|---|---------------|-----------------------|------------------|
| Specificities                             | 0.2462        | 0.6923                | 0.5538           |
| AUC                                       | 0.9765        | 0.9897                | 0.9858           |
| Selected<br>Lambda                        | 0             | 0.0101                | 0.0006           |
| Number of<br>Variables (w/o<br>Intercept) | 20            | 6                     | 16               |

### Discussion

- ► Goal is accurately classify every patient
- Balancing Sensitivity vs. Specificity.
  - ► In first screening cases want to catch every case. Maximize Sensitivity.
